

Presentation Assignment

Session: 2020-2021

Recreate Your Residence in SketchUp

Marks 50	Mode Individual	Assessment Live Presentation
-------------	--------------------	---------------------------------

Purpose

The purpose of this assignment is to gain practical familiarity with SketchUp as a general-purpose 3D modeling tool. By recreating a real place that you know well, you will practice observing real-world geometry, translating it into a 3D model, organizing model elements, and communicating the result visually.

Task

Choose the house, apartment building, or residence where you currently live (or your family home) and recreate it as a 3D model in SketchUp. **You may use either SketchUp Desktop or SketchUp for Web.**

- Use one or more real photographs of the selected residence as your primary visual reference.
- Recreate the visible form of the building in 3D, including the main massing, floors, roof, openings, balconies, projections, and other important features that define its appearance.
- The model does not need to be an engineering-grade survey. Reasonable approximation is acceptable, but proportions and visible features should correspond convincingly to the reference.
- You are encouraged to go beyond the minimum model by adding architectural details, materials, surroundings, furniture/interior elements, or other relevant features where appropriate.

What to Present

1. Reference: Show the photograph(s) of the real residence used as the basis of your model.
2. SketchUp Model: Open the actual SketchUp model and show it from multiple viewpoints. You should be able to orbit, pan, zoom, and navigate the model during the presentation.
3. Brief Explanation: Explain how you constructed the major parts of the model and point out the details or enhancements you added.
4. Final Render: Show at least one realistic rendered or visually enhanced image based on your completed 3D model.

Presentation format: A separate slide deck is not required. You may present directly using your reference images, SketchUp model, and final rendered image(s).

Submission / Materials to Bring

- The SketchUp project/model file, or a working online SketchUp project that can be opened during the presentation.
- The original reference photograph(s).
- At least one final rendered or enhanced image of the model.

Marking Scheme

Component	Assessment Focus	Marks
Core 3D Model	A complete, recognizable model of the selected residence; main geometry, overall structure, proportions, openings, major architectural elements, and correspondence with the reference.	30
Live Presentation & Model Handling	Ability to open and navigate the model, show relevant views, and briefly explain how major parts were created.	5
Detail & Enhancement	Additional modeling effort beyond the basic form: finer architectural details, materials, railings/grilles, stairs, roof details, surroundings, interior/furniture elements, organization, or other thoughtful enhancements.	10
Final Rendering	Quality of one or more realistic rendered/enhanced views based on the completed model.	5
Total		50

Important Notes

- The 3D model itself must be created in SketchUp and must be available for live inspection during the presentation.
- For the final rendered image(s), you may use rendering, image-enhancement, or generative-AI tools. However, the result should clearly remain based on and consistent with your own SketchUp model.
- Marks are not awarded simply for making the model visually complex. A clear, well-proportioned model that matches the real reference is more important than unnecessary detail.
- Additional detail and creative enhancement can earn higher marks after the core model requirements have been satisfied.

Tip: Choose a residence for which you can obtain clear photographs from multiple angles. This will make the modeling process easier and your final presentation more convincing.
